4. The particles in a gas move more rapidly than the particles in a liquid and have more kinetic energy on average. But water flows on if the same amount of energy is transferred to gas particles. liquid the kinetic energy of the particles in a gas will move more rapidly than the kinetic energy of particles in a liquid.

5. Convection—movement of the hot water as it is equalized down, then cools and returns to, within the hot and cold water.

6. Students should defend their answers. A hot cup of tea will transfer heat energy, result in temperature change, and cool to heat. A thin aluminum foil will transfer heat quickly, has a high surface temperature directly over the flame and cools quickly.

SECTION: USING HEAT

1. A deep oven has water that absorbs heat energy and evaporates as the air flows through it. Because the air loses heat energy to the water, the air cools.

2. a. No, the refrigerator releases heat from inside the box out the back of the unit. The refrigerator warms the room, so the heat is still released into the kitchen.
b. Yes, because electrical energy runs the refrigerator that generates heat.
c. Yes, because the large area of a radiator acts as a radiator to radiate heat from the radiator's coils.

3. The refrigerator has to be at different temperatures such as an inside wall and outside wall, should be separated by an insulating layer so that they are not having to work to eliminate heat loss by conduction.

4. A down jacket does not use equal length, instead it compresses the full air volume so much that a quilt is lighter.
